

GDPR and you

GDPR

New GDPR laws are here. As a Drupal developer there are actions you need to take and workflow adjustments you need to make.

What to do now

- Check your machines/development environments for client database backups and **remove**.
- If keeping client databases locally ensure any user data is **encrypted or anonymised**.
- Are clients sending you lists of user data via email? **Tell them to stop.**

Check for data

encrypt or remove

- User tables
- Webform submission table
- Webform emails table
- Commerce order table
- Commerce profile tables
- Commerce payment gateway callback tables (paypal etc)

Going forward

stay vigilant

- Ensure any future development environments are built using an encrypted/anonymised database.
- If you receive user data via an email, immediately delete the email and any attachments.
- Speak to clients about changes that need to be made to their sites.
